

CABINET C3

Cabinet sandblasting has various characteristics:

- You can work at higher pressure and using more abrasive.
- Different nozzles can be used for different jobs.
- You can view your progress through the glass.

These advantages mean that engravings can be done almost twice as quickly as with a brush sandblaster. And using the same mask means greater quality and depth in your engravings.

Our cabinets feature double side doors that are sturdy enough for larger pieces to be inserted into the cabinet from one side to another on a roller rail. The doors have thin nylon strips to stop the dust and abrasive from escaping when the doors are left open. The cabinet also includes an abrasive decanting chamber and a dust aspiration system with a self-cleaning filter system that uses blasts of air to suck up the dust so you can see clearly while you work.
